Abstract
We present a classification of the possible quantum deformations of the supergroup $GL(1|1)$ and its Lie superalgebra $gl(1|1)$. In each case, the (super)commutation relations and the Hopf structures are explicitly computed. For each $R$ matrix, one finds two inequivalent coproducts whether one chooses an unbraided or a braided framework while the corresponding structures are isomorphic as algebras. In the braided case, one recovers the classical algebra $gl(1|1)$ for suitable limits of the deformation parameters but this is no longer true in the unbraided case.

Résumé
Nous présentons une classification des déformations quantiques du supergroupe $GL(1|1)$ et de sa superalgèbre $gl(1|1)$. Dans chaque cas, les relations de (super)commutation et les structures de Hopf sont calculées explicitement. Pour chaque matrice $R$, on trouve deux coproduits inéquivalents selon que l’on choisit un schéma tressé ou non, alors que les structures correspondantes sont isomorphes en tant qu’algèbres. Dans le cas tressé, on retrouve l’algèbre classique $gl(1|1)$ pour des limites convenables des paramètres de déformation, mais ceci n’est plus vrai dans le cas non tressé.
1 Introduction

The method of $R$-matrix [1–5] for constructing quantum groups has already been generalized to quantum supergroups. For example, three non-equivalent such quantum supergroups have been derived recently for the fermionic oscillator group [6]. Another example deals with $GL(1|1)$, another four dimensional supergroup. The standard one-parameter deformation $GL_q(1|1)$ is well-known [7, 8, 9] and has been generalized to two parameters [10, 11]. An alternative deformation has also been derived [12].

These last deformations are based on the choice of an $4 \times 4$ $R$-matrix which satisfies the constant quantum Yang-Baxter equation (YBE). A complete set of such solutions has been constructed [13] and may be the starting point for considering all possible continuous deformations of the linear group $GL(2)$ and supergroup $GL(1|1)$. The extra conditions that have to be satisfied to this aim leads us to pick only solutions which are nonsingular $R$-matrices continuously related to some diagonal matrices.

It is already known that all the possible deformations of $GL(2)$ that possess a central determinant are given by the standard one [1, 4] and the non-standard (or “Jordanian”) one [14, 15]. Let us mention that they are both one-parameter deformations. Once the condition of central determinant is relaxed, we can show [16] that this “Jordanian” matrix contains two parameters and the computation of the quantum algebra dual to the quantum group is much more difficult and not known.

The quantum deformations of the group $GL(1|1)$ has until now not led to an exhaustive study. So the question addressed here is to give such a study and construct deformations both of the supergroup and superalgebra structures. Let us notice that our approach deals with deformations of superstructures with even parameters in comparison with other recent approaches [17].

A point which is important and has already been mentionned [18] is the fact that what distinguish the group and supergroup deformations is that the corresponding $R$-matrices are continuous deformations of the identity matrix in the first case and of the superidentity matrix (i.e. $\text{diag}(1, 1, 1, -1)$) in the second.

While the paper will be concerned by the supergroup deformations, it is useful to present the necessary definitions for the usual group $GL(2)$ and point out the differences for the supergroup $GL(1|1)$.

So, let us consider the Lie group $G = GL(2)$, its Lie algebra $\mathcal{G} = gl(2)$ with generators $A, B, C, D$ such that

$$\begin{align*}
\end{align*}$$

(1)

and $\mathcal{U}$ the universal enveloping algebra of $\mathcal{G}$. The algebra $\mathcal{A} = \text{Fun}(GL(2))$ is the associative unital algebra with generators $a, b, c, d$ that commute:

$$[a, b] = [a, c] = [a, d] = [b, c] = [b, d] = [c, d] = 0.$$  

(2)

The two algebras $\mathcal{U}$ and $\mathcal{A}$ can be endowed with a Hopf structure, each element of $\mathcal{G} \subset \mathcal{U}$ being primitive for the comultiplication $\Delta$ (i.e. $\forall X \in \mathcal{G}$, $\Delta(X) = X \otimes 1 + 1 \otimes X$) and the comultiplication $\Delta$ for $\mathcal{A}$ is implied by the usual matrix multiplication law: $\Delta T = T \otimes T$ if $T = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, that is

$$\begin{align*}
\Delta a &= a \otimes a + b \otimes c, & \Delta b &= a \otimes b + b \otimes d, \\
\Delta c &= c \otimes a + d \otimes c, & \Delta d &= c \otimes b + d \otimes d.
\end{align*}$$

(3)
Moreover, there exists a nondegenerate bilinear form \( \langle \cdot, \cdot \rangle \) on \( U \times A \) such that
\[
\langle A, a^k d^m b^n c^o \rangle = k \delta_{m0} \delta_{n0}, \quad \langle B, a^k d^m b^n c^o \rangle = \delta_{m1} \delta_{n0}, \quad \langle C, a^k d^m b^n c^o \rangle = \delta_{m0} \delta_{n1}, \quad \langle D, a^k d^m b^n c^o \rangle = l \delta_{m0} \delta_{n0},
\]
where \( a^k d^m b^n c^o \) is any element of a Poincaré–Birkhoff–Witt basis of \( A \) \((k, l, m, n \in \mathbb{N})\). Finally, the pairing \( \langle \cdot, \cdot \rangle \) satisfies
\[
\langle P_1 P_2, x \rangle = \langle m(P_1 \otimes P_2), x \rangle = \langle P_1 \otimes P_2, \Delta(x) \rangle
\]
and
\[
\langle \Delta(P), x \otimes y \rangle = \langle P, m(x \otimes y) \rangle = \langle P, xy \rangle
\]
where \( P_1, P_2 \in U, x, y \in A \) and \( m \) denotes the multiplication.

These definitions may be extended to the Lie supergroup \( GL(1|1) \) and the Lie superalgebra \( gl(1|1) \). If we call as before its generators by \( A, B, C, D \), then we have
\[
\{A, B\} = -\{D, B\} = B, \quad \{A, C\} = -\{D, C\} = -C, \quad \{B, C\} = A + D, \quad \{A, D\} = \{B, B\} = \{C, C\} = 0.
\]

Now the algebra \( A = Fun(GL(1|1)) \) with generators \( a, b, c, d \) satisfies:
\[
[a, b] = [a, c] = [a, d] = [b, c] = 0, \quad \{b, d\} = \{c, d\} = b^2 = c^2 = 0.
\]

Deformations of the defining relations (1)–(2) or (7)–(8) are provided by the Faddeev–Reshetikhin–Takhtajan formalism [4]. Let us define \( T_1 = T \otimes I, T_2 = I \otimes T \). Then the deformations are given by
\[
RT_1 T_2 = T_2 T_1 R,
\]
where \( R \) is a \( 4 \times 4 \) matrix that satisfies the quantum Yang-Baxter equation (YBE)
\[
R_{12} R_{13} R_{23} = R_{23} R_{13} R_{12},
\]
the last equation standing in \( \text{End}(\mathbb{C}^2) \otimes \text{End}(\mathbb{C}^2) \otimes \text{End}(\mathbb{C}^2) \).

As we said before, the \( 4 \times 4 \) constant \( R \)-matrices satisfying the YBE have been classified in [13] and among them, the subset of non singular \( R \)-matrices splits into two different classes:

- \( i \) the ones continuously connected to the identity matrix \( \text{diag}(1, 1, 1, 1) \), which yield to quantum deformations of the group \( GL(2) \): eq. (9) deforms the relations (2);
- \( ii \) the ones continuously connected to the diagonal matrix \( \text{diag}(1, 1, 1, -1) \), which yield to quantum deformations of the supergroup \( GL(1|1) \): eq. (9) deforms the relations (8).

In the first class, there is only two distinct deformations (one case has been discussed by Fronsdal et al. [19] and some work [14, 15] has been done on the second case specializing in the one-parameter deformation).

Let us in the following concentrate on the second class of deformations, namely the ones of \( gl(1|1) \).
2 Deformations of the supergroup $GL(1|1)$

The class of $R$-matrices satisfying the YBE and continuously connected to diag$(1,1,1,-1)$ consists of three inequivalent matrices:

\[ R_{2,2} = \begin{pmatrix} r & 0 & 0 & 0 \\ 0 & 1 & r(1-q^{-1}) & 0 \\ 0 & 0 & 0 & r^2 q^{-1} \\ 0 & 0 & 0 & rq^{-1} \end{pmatrix}, \] (11)

\[ R_{1,2} = \begin{pmatrix} 1 & 0 & 0 & r \\ 0 & 1 & 1-q^{-1} & 0 \\ 0 & 0 & q^{-1} & 0 \\ 0 & 0 & 0 & -q^{-1} \end{pmatrix}, \] (12)

\[ R_{1,1} = \frac{1}{r} \begin{pmatrix} s+1 & 0 & 0 & s \\ 0 & r & s & 0 \\ 0 & s & r & 0 \\ s & 0 & 0 & s-1 \end{pmatrix}. \] (13)

The first two matrices are really two-parameter matrices while the last one is a one-parameter matrix, the numbers $r, s$ being subject to the condition $r^2 - s^2 = 1$ for the matrix $R_{1,1}$.

The first case is already known, but in order to get a complete classification, we remind here the results. The multiplication law between the generators of $\mathcal{A}_{2,2}$ is given by

\[
\begin{align*}
ba - rab &= 0, & rca - qac &= 0, \\
bd + rdb &= 0, & rcd + qdc &= 0, \\
ad - da + r^{-1}(q - 1)bc &= 0, & r^2 cb - qbc &= 0, \\
b^2 &= c^2 = 0.
\end{align*}
\] (14)

**Theorem 0** [11] The supercommutation relations for the dual algebra $U_{2,2}$, quantum deformation of the Lie superalgebra $gl(1|1)$ associated to the $R$-matrix $R_{2,2}$, are given by:

\[
\begin{align*}
\{A, D\} &= 0, & \{C, C\} &= \{B, B\} = 0, \\
\{B, C\} &= \frac{q^{A+D} - 1}{q - 1},
\end{align*}
\]

and the comultiplication structure by:

\[
\begin{align*}
\Delta(A) &= 1 \otimes A + A \otimes 1, & \Delta(B) &= 1 \otimes B + B \otimes (-1)^D r^{A+D}, \\
\Delta(D) &= 1 \otimes D + D \otimes 1, & \Delta(C) &= 1 \otimes C + C \otimes (-1)^D \left(\frac{q}{r}\right)^{A+D}.
\end{align*}
\]
3 The case $R_{1,2}$

The multiplication law between the generators of $A_{1,2}$ is obtained from (9) with $R = R_{1,2}$ as:

\begin{align*}
ba - ab + rqdc & = 0, \quad ca - qac = 0, \\
bd + db - rqac & = 0, \quad cd + qdc = 0, \\
ad - da - (1 - q)bc & = 0, \quad cb - qbc = 0, \\
(1 + q)b^2 - rq(a^2 - d^2) & = 0, \quad c^2 = 0.
\end{align*}  

(15)

The structure relations of the corresponding dual algebra $U_{1,2}$ will be obtained by computing the action of the (anti)commutators between the generators $A, B, C, D$ of $U_{1,2}$ on a Poincaré–Birkhoff–Witt basis of $A_{1,2}$. Such a basis is generated by the generic elements of the type $a^k d^l b^m c^n$ where $k, l \in \mathbb{N}$ and $m, n \in \{0, 1\}$ thanks to the two last relations of (15). Moreover, eq. (5) requires the knowledge of the comultiplication $\Delta(a^k d^l b^m c^n)$. In the case under consideration, such a computation can be done directly and we have the following lemma:

Lemma 1

\begin{align*}
\Delta(a^k) & = a^k \otimes a^k + \frac{q^k - 1}{q - 1} a^{k-1} b \otimes a^{k-1} c - \frac{rq^2(q^k - 1)(q^{k-1} - 1)}{(q^2 - 1)(q - 1)} a^{k-2} dc \otimes a^{k-1} c, \\
\Delta(d^l) & = d^l \otimes d^l + \frac{q^l - 1}{q - 1} d^{l-1} c \otimes d^{l-1} b - \frac{rq^2(q^l - 1)(q^{l-1} - 1)}{(q^2 - 1)(q - 1)} d^{l-1} c \otimes ad^{l-2} c.
\end{align*}

Proof: These relations are easily proved by recurrence on $k$ and $l$, using eqs. (3) and (15).

One has, from the fact that $\Delta$ is an algebra homomorphism,

\begin{align*}
\Delta(a^k d^l) & = a^k d^l \otimes a^k d^l + q^l \frac{(q^k - 1)(q^l - 1)}{(q - 1)^2} (a^{k-1} d^{l-1} bc \otimes a^{k-1} d^{l-1} bc - rqa^{k-1} d^{l-1} bc \otimes a^{k-1} d^l c) \\
& \quad + \frac{q^l - 1}{q - 1} \left( a^{k-1} d^{l-1} c \otimes a^{k-1} d^{l-1} b - \frac{rq^2d^{l-1} - 1}{q^2 - 1} a^{k-1} d^{l-1} c \otimes a^{k+1} d^{l-2} c \right) \\
& \quad + \frac{q^l q^{k-1} - 1}{q - 1} \left( a^{k-1} d^l b \otimes a^{k-1} d^l c - \frac{rq^2(d^l - 1)}{q^2 - 1} a^{k-2} d^{l+1} c \otimes a^{k-1} d^l c \right).
\end{align*}  

(16)

In the same way, one can deduce

\begin{align*}
\Delta(a^k d^l c) & = a^k d^l c \otimes a^{k+1} d^l + a^k d^{l+1} \otimes a^k d^l c - \frac{q^l - 1}{q - 1} a^k d^l c \otimes a^{k+1} d^l bc \\
& \quad + \frac{q^{l+1} q^{k-1} - 1}{q - 1} a^{k-1} d^l bc \otimes a^k d^{l+1} c,
\end{align*}  

(17)

and finally

\begin{align*}
\Delta(a^k d^l b) & = a^{k+1} d^l \otimes a^k d^l b + a^k d^l b \otimes a^{k+1} d^l - \frac{q^l - 1}{q - 1} a^k d^{l-1} bc \otimes a^{k+1} d^l b + \frac{q^{l+1} q^k - 1}{q - 1} a^k d^l b \otimes a^{k-1} d^l bc \\
& \quad - \frac{rq^{l+2}q^k - 1}{q^2 - 1} a^{k-1} (a^2 - d^2) d^l \otimes a^{k-1} d^{l+1} c + \frac{rq^2q^l - 1}{q^2 - 1} a^{k+1} d^{l-1} c \otimes a^k (a^2 - d^2) d^{l-1} \\
& \quad - \frac{rq^2(q^l - 1)(q^{l-1} - 1)}{(q^2 - 1)(q - 1)} a^{k+1} d^{l-1} c \otimes a^{k+1} d^{l-2} bc + \frac{rq^{2l+4}(q^k - 1)(q^{k-1} - 1)}{(q^2 - 1)(q - 1)} a^{k-2} d^{l+1} bc \otimes a^{k-1} d^{l+1} c
\end{align*}  

(18)
Theorem 1. The supercommutation relations for the dual algebra $U_{1,2}$, quantum deformation of the Lie superalgebra $\mathfrak{gl}(1|1)$ associated to the R-matrix $R_{1,2}$, are given by (we have set $K = q^{A+D}$):

\[
\begin{align*}
[A, D] &= 0, \quad \{B, C\} = \frac{K - 1}{q - 1}, \\
[A, B] &= -[D, B] = B, \\
[A, C] &= -[D, C] = -C - \frac{2rq}{q^2 - 1}(K - q)B, \\
\{C, C\} &= -\frac{2rq}{(q^2 - 1)(q - 1)}(K - 1)(K - q), \quad \{B, B\} = 0.
\end{align*}
\]

Note that the element $K$ is central in $U_{1,2}$: $[K, X] = 0$ for $X \in \{A, B, C, D\}$.

**Proof:** Using the formulae (16), (17), (18) and (19), we see that the non vanishing pairings are the following:

\[
\begin{align*}
\langle BC + CB, a^k d^l \rangle &= \frac{q^{k+l} - 1}{q - 1}, \\
\langle AB - BA, a^k d^l b \rangle &= -\langle DB - BD, a^k d^l b \rangle = 1, \\
\langle AC - CA, a^k d^l c \rangle &= -\langle DC - CD, a^k d^l c \rangle = -1, \\
\langle AC - CA, a^k d^l b \rangle &= -\langle DC - CD, a^k d^l b \rangle = -2rq^2 \frac{q^{k+l} - 1}{q^2 - 1}, \\
\langle C^2, a^k d^l \rangle &= -rq^2 \frac{(q^{k+l} - 1)(q^{k+l-1} - 1)}{(q^2 - 1)(q - 1)}.
\end{align*}
\]

To go from formulae (20) to the equations of Theorem 1, we need the following expressions:

\[
\begin{align*}
\langle A^n, a^k d^l \rangle &= \langle \otimes_n A, \Delta^{(n)}(a^k d^l) \rangle = k^n \\
\langle D^n, a^k d^l \rangle &= \langle \otimes_n D, \Delta^{(n)}(a^k d^l) \rangle = l^n
\end{align*}
\]

obtained from the coproduct (3) and the multiplication law (15). It follows immediately that

\[
\langle q^A, a^k d^l \rangle = q^k \quad \text{and} \quad \langle q^D, a^k d^l \rangle = q^l.
\]
Moreover, one has from eq. (18) (note the shift in the exponential!)
\[ \langle q^{A+D-1}B, a^kb^l \rangle = q^{k+l}. \] (23)

Then comparing eqs. (20), (22) and (23), we get the commutation relations of Theorem 1.

We want now to determine the comultiplication structure on \( U_{1,2} \). The duality relation (6) applied on the generic elements \( a^kd^lb^mc^n \) and \( a^kd^lb^m'c^n' \) of the Poincaré–Birkhoff–Witt basis of \( A_{1,2} \) reads as

\[ \langle \Delta(P), a^kd^lb^m c^n \otimes a^kd^lb^m'c^n' \rangle = \langle P, m(a^kd^lb^m c^n \otimes a^kd^lb^m'c^n') \rangle = \langle P, a^kd^lb^m c^n a^kd^lb^m'c^n' \rangle. \] (24)

If \( \Delta(P) = P^{(1)} \otimes P^{(2)} \) in Sweedler’s notation, one has

\[ \langle \Delta(P), a^kd^lb^m c^n \otimes a^kd^lb^m'c^n' \rangle = \langle P^{(1)}, a^kd^lb^m c^n \rangle \langle P^{(2)}, a^kd^lb^m'c^n' \rangle. \] (25)

From the knowledge of \( \langle P, a^kd^lb^m c^n a^kd^lb^m'c^n' \rangle \) as a function of \( k, l, m, n, k', l', m', n' \), and the duality relations (4), one can then deduce the possible \( P^{(1)} \) and \( P^{(2)} \) for any generator \( P \) of the dual algebra.

From formula (24), one has to compute the action of any generator of the algebra \( U_{1,2} \) on a generic element \( a^kd^lb^m c^n a^kd^lb^m'c^n' \) where \( m, n, m', n' = 0 \) or 1. Using the multiplication law (15), it is possible to reorder this generic element with respect to the ordering \( a b c d \) given by the duality relations (4). To this aim, we need the following lemma (reordering formulae):

**Lemma 2**

\[
\begin{align*}
 a^kd^la^kd' &= a^{k+k'}d^{l+l'} + q^r \frac{(q^r - 1)(q^l - 1)}{q - 1} a^{k+k'-1}d^{l+l'-1}bc, \\
 a^kd^lb^k &= a^{k+k'}d^{l+l'} + \frac{rq^2}{q^2 - 1} q^r (q^r - 1)(q^l - 1) a^{k+k'-1}(a^2 - d^2)d^{l+l'-1}c, \\
 a^kd^ld'c &= a^{k+k'}d^{l+l'}c, \\
 a^kd'ba^kd' &= -1)^r a^{k+k'}d^{l+l'}b + (-1)^r \frac{rq^2}{q^2 - 1} q^r (q^r - 1)(q^l - 1) a^{k+k'-1}(a^2 - d^2)d^{l+l'-1}c \\
 &- (-1)^r \frac{rq^r + 1}{q - 1} (q^r - 1) a^{k+k'+1}d^{l+l'-1} - (-1)^r \frac{rq^l + 1}{q - 1} (q^l - 1)a^{k+k'-1}d^{l+l'+1}, \\
 a^kd'ca^kd' &= -1)^r a^{k+k'}d^{l+l'}c, \\
 a^kd'ba^kd' &= -1)^r \frac{rq^2}{q + 1} a^{k+k'}d^{l+l'} + (-1)^r \frac{rq^l + 1}{q - 1} (q^r - 1) a^{k+k'+1}d^{l+l'-1}bc \\
 &- (-1)^r \frac{rq^2}{q - 1} (q^r - 1) a^{k+k'+1}d^{l+l'-1}bc - (-1)^r \frac{rq^l}{q - 1} (q^l - 1) a^{k+k'-1}d^{l+l'+1}bc \\
 &+ (-1)^r \frac{rq^3}{q^2 - 1} q^r (q^r - 1)(q^l - 1)a^{k+k'+1}(a^2 - d^2)d^{l+l'-1}bc, \\
 a^kd'ba^kd'c &= -1)^r a^{k+k'}d^{l+l'}bc, \\
 a^kd'ca^kd' &-1)^r a^{k+k'}d^{l+l'}bc, \\
 a^kd'ba^kd'c &= -1)^r \frac{rq^2}{q + 1} a^{k+k'}d^{l+l'}bc, \\
 a^kd'ca^kd'c &= -1)^r a^{k+k'}d^{l+l'}bc, \\
 a^kd'bca^kd' &= -1)^r \frac{rq^2}{q^2 - 1} a^{k+k'}d^{l+l'}bc, \\
 a^kd'ca^kd' &= -1)^r a^{k+k'}d^{l+l'}bc = a^kd'bca^kd'c = a^kd'bca^kd'bc = 0.
\end{align*}
\]
The proof of the lemma is straightforward and is done by recurrence on \(k, l, k', l'\) from eq. (15).

**Theorem 2** The comultiplication \(\Delta\) of the algebra \(\mathcal{U}_{1,2}\) is given by:

\[
\begin{align*}
\Delta(A) &= 1 \otimes A + A \otimes 1 + \frac{2rq}{q + 1} B \otimes (-1)^DB, \\
\Delta(B) &= 1 \otimes B + B \otimes (-1)^D, \\
\Delta(C) &= 1 \otimes C + C \otimes (-1)^D(K - 1) - \frac{rq}{q - 1} B \otimes (-1)^D(K - 1), \\
\Delta(D) &= 1 \otimes D + D \otimes 1 - \frac{2rq}{q + 1} B \otimes (-1)^DB.
\end{align*}
\]

Let us remark that the first and last equations of Theorem 2 imply that \(\Delta(K) = K \otimes K\).

**Proof:** It follows immediately from Lemma 2 that

\[
\begin{align*}
\langle \Delta(A), a^k d^l \otimes a^{k'} d^{l'} \rangle &= k + k', & \langle \Delta(A), a^k d^l b \otimes a^{k'} d^{l'} b \rangle &= (-1)^{l'} \frac{2rq}{q + 1}, \\
\langle \Delta(B), a^k d^l \otimes a^{k'} d^{l'} b \rangle &= 1, & \langle \Delta(B), a^k d^l b \otimes a^{k'} d^{l'} \rangle &= (-1)^{l'}, \\
\langle \Delta(C), a^k d^l \otimes a^{k'} d^l c \rangle &= 1, & \langle \Delta(C), a^k d^l c \otimes a^{k'} d^{l'} \rangle &= (-1)^{l'} q^{k' + l'}, \\
\langle \Delta(C), a^k d^l b \otimes a^{k'} d^{l'} \rangle &= -(-1)^{l'} rq \frac{q^{k' + l'} - 1}{q - 1}, \\
\langle \Delta(D), a^k d^l \otimes a^{k'} d^{l'} \rangle &= l + l', & \langle \Delta(D), a^k d^l b \otimes a^{k'} d^{l'} b \rangle &= -(-1)^{l'} \frac{2rq}{q + 1},
\end{align*}
\]

and all other possible terms vanish. These last relations then imply Theorem 2 by using the duality relations (4), (6) and (22). This achieves the proof.

**4 The case \(R_{1,1}\)**

The multiplication law between the generators of \(\mathcal{A}_{1,1}\) is given by the relation (9) with \(R = R_{1,1}\). One obtains:

\[
\begin{align*}
ba - rab + sdc &= 0, & ca - rac + sdb &= 0, \\
bd + rdb - sac &= 0, & cd + rdc - sab &= 0, \\
ad - da &= 0, & bc - cb &= 0, \\
b^2 &= c^2 = \frac{1}{2}(a^2 - d^2).
\end{align*}
\]

As before a Poincaré–Birkhoff–Witt basis of \(\mathcal{A}_{1,1}\) is given by \(a^k d^l b^m c^n\) where \(k, l \in \mathbb{N}\) and \(m, n \in \{0, 1\}\) thanks to the last relation of (27). The computation of the coproduct \(\Delta(a^k d^l b^m c^n)\) where \(k, l \in \mathbb{N}\) and \(m, n \in \{0, 1\}\) is much more involved than in the case \(\mathcal{U}_{1,2}\) because the multiplication law (27) does not allow to compute directly the quantities \(\Delta(a^k d^l b^m c^n)\). Instead, one has to solve many recursion formulae for \(\Delta(a^k d^l)\) in order to produce the desired results (see the Appendix).

**Theorem 3** The supercommutation relations for the dual algebra \(\mathcal{U}_{1,1}\), quantum deformation of the Lie superalgebra \(gl(1|1)\) associated to the \(R\)-matrix \(R_{1,1}\), are given by:

\[
\begin{align*}
[A, D] &= 0, \\
\{B, C\} &= \frac{1}{2} \left( \frac{K^2 - 1}{q^2 - 1} + \frac{K^{-2} - 1}{q^{-2} - 1} \right),
\end{align*}
\]
\[
\begin{align*}
[A, B] &= -[D, B] = \frac{1}{2}B + \frac{1}{4}(q^2K^2 + qK^{-2})B + \frac{1}{4}(q^{-2}K^2 - q^2K^{-2})C, \\
[A, C] &= -[D, C] = -\frac{1}{2}C - \frac{1}{4}(q^2K^2 + qK^{-2})C - \frac{1}{4}(q^{-2}K^2 - q^2K^{-2})B, \\
\{B, B\} &= \{C, C\} = -\frac{1}{2} \left( \frac{K^2 - 1}{q^2 - 1} - \frac{K^{-2} - 1}{q^{-2} - 1} \right).
\end{align*}
\]

Since \( r^2 - s^2 = 1 \), we have set for convenience \( r = \frac{1}{2}(q + q^{-1}), \ s = \frac{1}{2}(q - q^{-1}) \) and \( K \) is defined by \( K = q^{A+D} \).

Note again that the element \( K \) is central in \( U_{1,1} \).

**Proof:** The interested reader will find the details in the Appendix. \( \blacksquare \)

**Theorem 4** The comultiplication \( \Delta \) of the algebra \( U_{1,1} \) is given by:

\[
\begin{align*}
\Delta(A) &= 1 \otimes A + A \otimes 1 \\
&\quad + \frac{1}{4}(q - q^{-1}) \left( (B - C) \otimes (-1)^D q^{-1} K(B + C) + (B + C) \otimes (-1)^D q^{-1} (B - C) \right), \\
\Delta(B) &= 1 \otimes B + \frac{1}{2}(B - C) \otimes (-1)^D K + \frac{1}{2}(B + C) \otimes (-1)^D K^{-1}, \\
\Delta(C) &= 1 \otimes C - \frac{1}{2}(B - C) \otimes (-1)^D K + \frac{1}{2}(B + C) \otimes (-1)^D K^{-1}, \\
\Delta(D) &= 1 \otimes D + D \otimes 1 \\
&\quad - \frac{1}{4}(q - q^{-1}) \left( (B - C) \otimes (-1)^D q^{-1} K(B + C) + (B + C) \otimes (-1)^D q^{-1} (B - C) \right).
\end{align*}
\]

Again the first and last equations of Theorem 4 imply that \( \Delta(K) = K \otimes K \).

**Proof:** The proof of Theorem 4 stands along the same lines than the proof of Theorem 2. From formula (24), one computes the action of any generator of the algebra \( U_{1,1} \) on a generic element \( a^k d^l b^m c^n a^{k'} d'^l b'^m c'^n \) where \( m, n, m', n' \in \{0, 1\} \). All that remains to do is to reorder this generic element with respect to the ordering \( adb \) given by the duality relations (4). The reordering formulae are much simpler than in the \( U_{1,2} \) case. Indeed, we have from eq. (27)

\[
(b \pm c)a^k d^l = (ra \mp sd)^k(\pm sa - rd)^l(b \pm c), \tag{28}
\]

hence

\[
\begin{align*}
ba^k d^l &= \frac{1}{2} \left( (ra - sd)^k(sa - rd)^l(b + c) + (ra + sd)^k(-sa - rd)^l(b - c) \right) \equiv \xi_{kl}^b, \\
ca^k d^l &= \frac{1}{2} \left( (ra - sd)^k(sa - rd)^l(b + c) - (ra + sd)^k(-sa - rd)^l(b - c) \right) \equiv \xi_{kl}^c. \tag{29}
\end{align*}
\]

Then, for any \( X \in \{A, B, C, D\} \), one has

\[
\langle \Delta(X), a^k d^l b^m c^n \otimes a^{k'} d'^l b'^m c'^n \rangle = \begin{cases}
\langle X, a^k d^l b^m c^n a^{k'} d'^l b'^m c'^n \rangle & \text{if } m = n = 0 \\
\frac{1}{2} \langle X, a^{k+k'} d^{l+l'} b^m c^n \xi_{kl}^b \rangle & \text{if } m = 1, n = 0 \\
\frac{1}{2} \langle X, a^{k+k'} d^{l+l'} \xi_{kl}^b c'^n b'^m \rangle & \text{if } m = 0, n = 1 \\
\frac{1}{2} \langle X, a^{k+k'} d^{l+l'} \xi_{kl}^c b'^m c'^n \rangle & \text{if } m = 1, n = 1 
\end{cases}. \tag{30}
\]

10
It follows immediately from eqs. (29) and (30) that
\[
\langle \Delta(A), a^k d^l \otimes a^{k'} d'^l \rangle = k + k',
\]
\[
\langle \Delta(A), a^k d^l b \otimes a^{k'} d'^l b \rangle = \langle \Delta(A), a^k d^l c \otimes a^{k'} d'^l c \rangle = \frac{1}{4} (q - q^{-1}) (-1)^l (q^{k'+l'} + q^{k'-l'}) , (31a)
\]
\[
\langle \Delta(A), a^k d^l b \otimes a^{k'} d'^l c \rangle = \langle \Delta(A), a^k d^l c \otimes a^{k'} d'^l b \rangle = -\frac{1}{4} (q - q^{-1}) (-1)^l (q^{k'+l'} - q^{k'-l'}) , (31b)
\]
\[
\langle \Delta(D), a^k d^l \otimes a^{k'} d'^l \rangle = l + l',
\]
\[
\langle \Delta(D), a^k d^l b \otimes a^{k'} d'^l b \rangle = \langle \Delta(D), a^k d^l c \otimes a^{k'} d'^l c \rangle = -\frac{1}{4} (q - q^{-1}) (-1)^l (q^{k'+l'} + q^{k'-l'}) , (31c)
\]
and all other possible terms vanish. These last relations then imply Theorem 4 by using the duality relations (4), (6) and (80), (81) (for these relations, see the last ♦ item of the Appendix). This achieves the proof.

5 Braided structures

In the case of the standard deformed superalgebra \( gl(1|1) \), it is known that there exist two different Hopf algebras \( U_q[gl(1|1)] \) and \( U_q[gl(1|1)]' \), the two structures being isomorphic as algebras but exhibiting two distinct Hopf structures. The former admits \( gl(1|1) \) as classical limit when \( q \to 1 \) while such a limit does not exist for the latter, \( U_q[gl(1|1)]' \) being related to \( U_q[sl(2, \mathbb{C})] \) at a root of unity \( (i^2 = -1) \). A similar behaviour was proved in [11] for the \( U_{2,2} \) case. This is a general feature as we will see below.

The existence of two inequivalent Hopf structures is related to the fact that one can choose a braided or an unbraided framework.

In the unbraided case, the deformations of relations (8) are given by (9): one finds the results stated in the previous sections. As can be seen from Theorems 0, 2 and 4, the corresponding deformations \( U_{2,2}, U_{1,2}, U_{1,1} \) do not admit the classical superalgebra \( gl(1|1) \) as a limit for suitable values of the deformation parameters (it is clear from the comultiplication formulae that \((-1)^D \) does not reduce to unity in such a limit).

In the braided case, one has to introduce a “braiding matrix” chosen here as the superidentity matrix \( \text{diag}(1, 1, 1, -1) \). The braided version of (9) reads as:
\[
R \hat{T}_1 \hat{T}_2 = \hat{T}_2 \hat{T}_1 R ,
\]
(32)
where \( \hat{T}_i = \eta T_i \) \( (i = 1, 2) \).
For \( R = \text{diag}(1, 1, 1, -1) \), the generators of the algebra \( \mathcal{A} = \text{Fun}(GL(1|1)) \) satisfy now (compare with relations (8)); note that the relations (33) are consistent with a natural \( \mathbb{Z}_2 \)-gradation with the assignment \( a, d \) even and \( b, c \) odd:
\[
[a, b] = [a, c] = [a, d] = [b, d] = [c, d] = 0 , \quad \{ b, c \} = b^2 = c^2 = 0 .
\]
(33)
When the $R$-matrix is not trivial, it is easy to compute the modified multiplication laws for the cases $R_{2,2}$, $R_{1,2}$, $R_{1,1}$ corresponding to the deformations of (33). One finds:

for $A_{2,2}$:

\begin{align}
ba - rab &= 0, \\
bd - rdb &= 0, \\
ad - da + r(1 - q^{-1})cb &= 0, \\
b^2 &= c^2 = 0. \\
rca - qac &= 0, \\
rcd - qdc &= 0, \\
r^2cb + qbc &= 0, \\
(34a)
\end{align}

for $A_{1,2}$:

\begin{align}
ba - ab + rqdc &= 0, \\
bd - db + rqac &= 0, \\
ad - da + (1 - q)bc &= 0, \\
(1 + q)b^2 - rq(a^2 - d^2) &= 0, \\
ca - qac &= 0, \\
ca - qac &= 0, \\
bc + qbc &= 0, \\
c^2 &= 0. \\
(34b)
\end{align}

for $A_{1,1}$:

\begin{align}
ba - rab + sdc &= 0, \\
bd - rdb + sac &= 0, \\
ad - da &= 0, \\
b^2 &= -c^2 = \frac{1}{2} s(a^2 - d^2). \\
ca - rac + sdb &= 0, \\
ca -rac + sdb &= 0, \\
bc + cb &= 0, \\
(34c)
\end{align}

One can convince oneself, although it requires some work, that the (super)commutation relations of the corresponding dual algebras $U_{2,2}, U_{1,2}, U_{1,1}$ are unchanged. In this respect the relations (34) just express the original algebras in a different basis. However, the Hopf structures are not equivalent to the ones presented in the previous sections. One finds the following results for the comultiplication (compare with Theorems 0, 2 and 4):

for $U_{2,2}$:

\begin{align}
\Delta(A) &= 1 \otimes A + A \otimes 1, \\
\Delta(B) &= 1 \otimes B + B \otimes r^{A+D}, \\
\Delta(C) &= 1 \otimes C + C \otimes \left(\frac{q}{r}\right)^{A+D}. \\
(35a)
\end{align}

for $U_{1,2}$:

\begin{align}
\Delta(A) &= 1 \otimes A + A \otimes 1 + \frac{2rq}{q+1} B \otimes B, \\
\Delta(B) &= 1 \otimes B + B \otimes 1 - \frac{2rq}{q+1} B \otimes B, \\
\Delta(C) &= 1 \otimes C + C \otimes q^{A+D} - \frac{rq}{q-1} B \otimes (q^{A+D} - 1). \\
(35b)
\end{align}

for $U_{1,1}$:

\begin{align}
\Delta(A) &= 1 \otimes A + A \otimes 1 \\
&\quad + \frac{1}{4}(q - q^{-1}) \left( (B - C) \otimes q^{A+D-1}(B + C) + (B + C) \otimes q^{-A-D+1}(B - C) \right), \\
\Delta(B) &= 1 \otimes B + \frac{1}{2}(B + C) \otimes q^{A+D} + \frac{1}{2}(B - C) \otimes q^{-A-D}, \\
\Delta(C) &= 1 \otimes C + \frac{1}{2}(B + C) \otimes q^{A+D} - \frac{1}{2}(B - C) \otimes q^{-A-D}, \\
\Delta(D) &= 1 \otimes D + D \otimes 1 \\
&\quad - \frac{1}{4}(q - q^{-1}) \left( (B - C) \otimes q^{A+D-1}(B + C) + (B + C) \otimes q^{-A-D+1}(B - C) \right). \\
(35c)
\end{align}

Notice that the $q$-deformed superalgebras $U_{2,2}, U_{1,2}$ and $U_{1,1}$ are now endowed with a super-Hopf structure, the comultiplication $\Delta$ and the tensor product being $\mathbb{Z}_2$-graded, this last one satisfying

\begin{align}
(X_1 \otimes Y_1)(X_2 \otimes Y_2) &= (-1)^{\deg Y_1 \cdot \deg X_2}(X_1X_2 \otimes Y_1Y_2), \\
(36)
\end{align}
the $\mathbb{Z}_2$-gradation being defined by setting $\deg A = \deg D = 0$ and $\deg B = \deg C = 1$.

It is easy to see that the relations (34) and (35) lead to the classical $GL(1|1)$ and $gl(1|1)$, endowing the superalgebra $gl(1|1)$ with a primitive comultiplication for suitable limits of the deformation parameters: $r, q \to 1$ for the $(2,2)$ case, $r \to 0, q \to 1$ for the $(1,2)$ case and $q \to 1$ (or $r \to 1, s \to 0$) for the $(1,1)$ case. Finally, the standard deformed superalgebra $U_r[gl(1|1)]$ can be obtained by taking $q = r^2$ in the case $U_{2,2}$.

6 Conclusion

Starting with a two-dimensional representation of the supergroup $GL(1|1)$ we have been able to exhibit three types of continuous deformations of both the supergroup and superalgebra structures. These are based on the $R$-matrix method where $R$ satisfies the YBE. Two of the three types are new with respect to preceding approaches of the same question.

It is remarkable to notice that these results coincide, at the algebra level, with those occuring in the fermionic oscillator quantum group approach [6]. Indeed, the algebra corresponding to this fermionic oscillator appears to be isomorphic to $gl(1|1)$. We started with a three dimensional representation of the corresponding group structure and obtained, with $9 \times 9$ $R$-matrices satisfying a weak version of YBE, three non isomorphic deformations of the superalgebra $gl(1|1)$ which can be compared with the ones obtained in this paper.

For $U_{2,2}$ the correspondence is immediate and this superalgebra is related to the type III fermionic oscillator quantum superalgebra.

For $U_{1,2}$, the change of basis $A' = A$, $D' = D$, $C' = C + \left(\frac{rq}{q^2 - 1}(K - q) + \frac{r(p - 1)}{2p^2}(K - 1)\right)B$ and $B' = \frac{q - 1}{p}B$ leads to (with $K = q^{A+D}$ and $p = \ln q$):

\[
\begin{align*}
[A', D'] &= 0, \\
\{B', C'\} &= \frac{K - 1}{p}, \\
[A', B'] &= -[D', B'] = B', \\
[A', C'] &= -[D', C'] = -C' - \frac{r}{p} (K - 1)B', \\
\{C', C'\} &= -\frac{r}{p^2} (K - 1)^2, \\
\{B', B'\} &= 0,
\end{align*}
\]

which is related to the type II fermionic oscillator quantum superalgebra.

Finally, for $U_{1,1}$, we notice that a more natural basis would be (with $K = q^{A+D}$):

\[
\begin{align*}
A' &= q \frac{K^2 + 1}{K^2 + q^2} A, \\
D' &= q \frac{K^2 + 1}{K^2 + q^2} D, \\
B' &= (1 - q^{-2})^{1/2} (B + C), \\
C' &= (q^2 - 1)^{1/2} (B - C),
\end{align*}
\]

since it gives

\[
\begin{align*}
[A', D'] &= 0, \\
\{B', C'\} &= 0, \\
[A', B'] &= -[D', B'] = \frac{1}{2}(1 + K^{-2})C', \\
[A', C'] &= -[D', C'] = \frac{1}{2}(1 + K^2)B', \\
\{B', B'\} &= 2(1 - K^{-2}), \\
\{C', C'\} &= 2(1 - K^2).
\end{align*}
\]
This last structure is easily seen to be equivalent to the type I fermionic oscillator quantum superalgebra (which clearly is a one-parameter deformation).

Appendix: Proof of theorem 3

As stated above, the evaluation of the action of the generators of $\mathcal{U}_{1,1}$ on the generic elements $a^k d^l b^m c^n$ of a Poincaré–Birkhoff–Witt basis of $\mathcal{A}_{1,1}$ requires the calculation of the coproduct of such an element. Let us define

$$
\Delta(a^k d^l) = \sum_{i,j,i',j' \in \{0,1\}} \Delta^{kl}_{ij,ij'} \left( \begin{pmatrix} a_1 \\ d_1 \end{pmatrix}, \begin{pmatrix} a_2 \\ d_2 \end{pmatrix} \right) b^i c^j \otimes b^{i'} c^{j'}.
$$

(37)

where the quantities $\Delta^{kl}_{ij,ij'} \left( \begin{pmatrix} a_1 \\ d_1 \end{pmatrix}, \begin{pmatrix} a_2 \\ d_2 \end{pmatrix} \right)$ are polynomials in the formal variables $a_1 = a \otimes 1$, $a_2 = 1 \otimes a$, $d_1 = d \otimes 1$, $d_2 = 1 \otimes d$.

From the product formula (5) and the duality relations (4), it is clear that the evaluation of the commutators between the generators of $\mathcal{U}_{1,1}$ on $a^k d^l b^m c^n$ is nothing but linear combinations of the polynomials $\Delta^{kl}_{ij,ij'} \left( \begin{pmatrix} a_1 \\ d_1 \end{pmatrix}, \begin{pmatrix} a_2 \\ d_2 \end{pmatrix} \right)$ and their derivatives for special values of the variables $a_1, a_2, d_1, d_2$.

More precisely, if $P(a, d)$ is a polynomial in the variables $(a, d)$, the duality relations (4) are equivalent to

$$
\langle A, P(a, d) b^m c^n \rangle = \frac{\partial}{\partial a} P(a, d) \bigg|_{a=d=1} \delta_m \delta_n, \quad \langle B, P(a, d) b^m c^n \rangle = P(a, d) \bigg|_{a=d=1} \delta_m \delta_n,
$$

$$
\langle C, P(a, d) b^m c^n \rangle = P(a, d) \bigg|_{a=d=1} \delta_m \delta_n, \quad \langle D, P(a, d) b^m c^n \rangle = \frac{\partial}{\partial d} P(a, d) \bigg|_{a=d=1} \delta_m \delta_n.
$$

(38)

Therefore, the evaluation of the different (anti)commutators on $a^k d^l$ gives:

$$
\langle BC + CB, a^k d^l \rangle = \Delta^{kl}_{10,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) + \Delta^{kl}_{01,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39a)

$$
\langle B^2, a^k d^l \rangle = \Delta^{kl}_{10,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right), \quad \langle C^2, a^k d^l \rangle = \Delta^{kl}_{01,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39b)

$$
\langle AB - BA, a^k d^l \rangle = \frac{\partial}{\partial a_1} \Delta^{kl}_{00,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) - \frac{\partial}{\partial a_2} \Delta^{kl}_{10,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39c)

$$
\langle AC - CA, a^k d^l \rangle = \frac{\partial}{\partial a_1} \Delta^{kl}_{00,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) - \frac{\partial}{\partial a_2} \Delta^{kl}_{01,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39d)

$$
\langle DB - BD, a^k d^l \rangle = \frac{\partial}{\partial d_1} \Delta^{kl}_{00,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) - \frac{\partial}{\partial d_2} \Delta^{kl}_{10,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39e)

$$
\langle DC - CD, a^k d^l \rangle = \frac{\partial}{\partial d_1} \Delta^{kl}_{00,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) - \frac{\partial}{\partial d_2} \Delta^{kl}_{01,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right),
$$

(39f)

$$
\langle AD - DA, a^k d^l \rangle = \frac{\partial^2}{\partial a_1 \partial d_2} \Delta^{kl}_{00,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) - \frac{\partial^2}{\partial a_2 \partial d_1} \Delta^{kl}_{00,00} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right).
$$

(39g)

We begin the proof by showing the following lemma:

**Lemma A.1**

$$
\Delta^{kl}_{10,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) = \frac{1}{4} \left( \frac{q^{2k+2l} - 1}{q^2 - 1} + \frac{q^{-2k-2l} - 1}{q^{-2} - 1} + 2(k-l) \right),
$$

$$
\Delta^{kl}_{01,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) = \frac{1}{4} \left( \frac{q^{2k+2l} - 1}{q^2 - 1} + \frac{q^{-2k-2l} - 1}{q^{-2} - 1} - 2(k-l) \right),
$$

$$
\Delta^{kl}_{01,01} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) = \Delta^{kl}_{10,10} \left( \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right) = -\frac{1}{4} \left( \frac{q^{2k+2l} - 1}{q^2 - 1} - \frac{q^{-2k-2l} - 1}{q^{-2} - 1} \right).
$$
Rewriting the multiplication law (27) in the following form:

\[(b \pm c)(\frac{a}{d}) = M_{\pm}(\frac{a}{d})(b \pm c) \quad \text{where} \quad M_{\pm} = \left( \begin{array}{cc} r & \mp s \\ \pm s & -r \end{array} \right), \quad (40)\]

it follows from eqs. (37) and (40) that

\[
\Delta(a^{k+1}d') = (a \otimes a + b \otimes c)\Delta(a^kd') \\
= (a \otimes a) \sum_{i,j,i',j' \in \{0,1\}} \Delta_{ij,i'j'}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right))b^i c^j \otimes b^{i'} c^{j'} \\
+ \frac{1}{4} \sum_{i,j,i',j' \in \{0,1\}} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_2 \Delta_{ij,i'j'}^{kl}(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})) \\
(b^{i+1}c^j + \varepsilon_1 b^i c^{j+1}) \otimes (b^{i'+1}c^{j'} + \varepsilon_2 b^{i'} c^{j'+1}), \quad (41)\]

Looking at the different terms in \(\Delta(a^{k+1}d')\), we get

\[
\Delta_{00,00}^{k+1}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) = a_1 a_2 \Delta_{00,00}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) + \frac{s^2}{16}(a_1^2 - d_1^2)(a_2^2 - d_2^2) \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} (\varepsilon_2 \Delta_{10,10}^{kl} + \Delta_{10,01}^{kl}) \\
+ \varepsilon_1 \varepsilon_2 \Delta_{01,10}^{kl} + \varepsilon_1 \Delta_{01,01}^{kl})(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})), \quad (42a)\]

\[
\Delta_{10,10}^{k+1}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) = a_1 a_2 \Delta_{10,10}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) + \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \frac{1}{4} \varepsilon_2 \Delta_{00,00}^{kl} + \frac{s}{8}(a_1^2 - d_1^2)\varepsilon_1 \varepsilon_2 \Delta_{11,10}^{kl} \\
+ \frac{s^2}{8}(a_2^2 - d_2^2)\Delta_{00,11}^{kl} + \frac{s^2}{16}(a_1^2 - d_1^2)(a_2^2 - d_2^2)\varepsilon_1 \Delta_{11,11}^{kl})(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})), \quad (42b)\]

\[
\Delta_{01,10}^{k+1}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) = a_1 a_2 \Delta_{01,10}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) + \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \frac{1}{4} \varepsilon_1 \Delta_{00,00}^{kl} + \frac{s}{8}(a_2^2 - d_2^2)\varepsilon_1 \varepsilon_2 \Delta_{00,11}^{kl} \\
+ \frac{s}{8}(a_1^2 - d_1^2)\Delta_{11,10}^{kl} + \frac{s^2}{16}(a_1^2 - d_1^2)(a_2^2 - d_2^2)\varepsilon_2 \Delta_{11,11}^{kl})(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})), \quad (42c)\]

\[
\Delta_{01,10}^{k+1}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) = a_1 a_2 \Delta_{01,10}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) + \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \frac{1}{4} \varepsilon_1 \varepsilon_2 \Delta_{00,00}^{kl} + \frac{s}{8}(a_1^2 - d_1^2)\varepsilon_1 \Delta_{11,10}^{kl} \\
+ \frac{s}{8}(a_2^2 - d_2^2)\varepsilon_1 \Delta_{00,11}^{kl} + \frac{s^2}{16}(a_1^2 - d_1^2)(a_2^2 - d_2^2)\varepsilon_2 \Delta_{11,11}^{kl})(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})), \quad (42d)\]

\[
\Delta_{10,01}^{k+1}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) = a_1 a_2 \Delta_{10,01}^{kl}(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right)) + \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \frac{1}{4} \Delta_{00,00}^{kl} + \frac{s}{8}(a_1^2 - d_1^2)\varepsilon_1 \Delta_{11,10}^{kl} \\
+ \frac{s}{8}(a_2^2 - d_2^2)\varepsilon_2 \Delta_{00,11}^{kl} + \frac{s^2}{16}(a_1^2 - d_1^2)(a_2^2 - d_2^2)\varepsilon_2 \Delta_{11,11}^{kl})(M_{\varepsilon_1}(\frac{a_1}{d_1}), M_{\varepsilon_2}(\frac{a_2}{d_2})), \quad (42e)\]
Taking now the values \(a_1 = a_2 = d_1 = d_2 = 1\), one has easily

\[
\Delta^{k,l+1}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{43a}
\]

\[
\Delta^{k,l+1}_{01,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{01,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \varepsilon_2 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{43b}
\]

\[
\Delta^{k,l+1}_{01,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{01,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{43c}
\]

\[
\Delta^{k,l+1}_{10,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{10,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_2 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{43d}
\]

\[
\Delta^{k,l+1}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right) = q^{-\varepsilon_1 - \varepsilon_2} \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right). \tag{43e}
\]

The last equation \((43e)\) can be solved and one finds

\[
\Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right) = q^{-k(\varepsilon_1 + \varepsilon_2)} \Delta^{kl}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right). \tag{44}
\]

In the same way, the recursion formulae for \(l\) is given by

\[
\Delta(a^k d^{l+1}) = (c \otimes b + d \otimes d) \Delta(a^k d^l)
\]

\[
= (d \otimes d) \sum_{i,j,i',j' \in \{0,1\}} \Delta^{k,l}_{ij,i'j'} \left( \left( \frac{a_1}{d_1}, \frac{a_2}{d_2} \right) \right) b^i c^j \otimes b^{i'} c^{j'}
\]

\[
+ \frac{1}{4} \sum_{i,j,i',j' \in \{0,1\}} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \Delta^{k,l}_{ij,i'j'} M_{\varepsilon_1} \left( \frac{a_1}{d_1} \right) M_{\varepsilon_2} \left( \frac{a_2}{d_2} \right) (b^{i+1} c^j + \varepsilon_1 b^i c^{j+1}) \otimes (b^{i'+1} c^{j'} + \varepsilon_2 b^{i'} c^{j'+1}). \tag{45}
\]

Looking at the different terms in \(\Delta(a^k d^{l+1})\), we obtain relations analogous to \((42)\), that lead to

\[
\Delta^{k,l+1}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \varepsilon_2 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{46a}
\]

\[
\Delta^{k,l+1}_{01,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{01,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{46b}
\]

\[
\Delta^{k,l+1}_{01,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{01,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_2 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{46c}
\]

\[
\Delta^{k,l+1}_{10,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{k,l}_{10,10} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \varepsilon_1 \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right), \tag{46d}
\]

\[
\Delta^{k,l+1}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right) = q^{-\varepsilon_1 - \varepsilon_2} \Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right). \tag{46e}
\]

Choosing \(k = 0\) in eq. \((46e)\) and taking into account eq. \((44)\), it follows that

\[
\Delta^{k,l}_{00,00} \left( q^{-\varepsilon_1} \left( \frac{1}{1}, q^{-\varepsilon_2} \left( \frac{1}{1} \right) \right) \right) = q^{-k(l)(\varepsilon_1 + \varepsilon_2)}. \tag{47}
\]

Plugging this last result into eqs. \((43a)-(43d)\), one gets

\[
\Delta^{k,l+1}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta^{kl}_{10,01} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{1}{4} \left( q^{2k+2l} + q^{-2k-2l} + 2 \right), \tag{48a}
\]
\[ \Delta_{00,10}^{k+1,l}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) = \Delta_{01,10}^{k+1,l}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) + \frac{1}{4} (q^{2k+2l} + q^{-2k-2l} - 2), \tag{48b} \]

\[ \Delta_{01,01}^{k+1,l}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) = \Delta_{01,01}^{kl}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) - \frac{1}{4} (q^{2k+2l} - q^{-2k-2l}), \tag{48c} \]

\[ \Delta_{10,10}^{k+1,l}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) = \Delta_{10,10}^{kl}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) - \frac{1}{4} (q^{2k+2l} - q^{-2k-2l}). \tag{48d} \]

Hence using eqs. (46a)–(46d), we obtain the results of the Lemma A.1. Then from eq. (39a) it follows that

\[ \langle \{B, C\}, a^k d^l \rangle = \frac{1}{2} \left( \frac{q^{2k+2l} - 1}{q^2 - 1} + \frac{q^{-2k-2l} - 1}{q^2 - 1} \right). \tag{49} \]

Similarly eq. (39b) leads to

\[ \langle B^2, a^k d^l \rangle = \langle C^2, a^k d^l \rangle = -\frac{1}{4} \left( \frac{q^{2k+2l} - 1}{q^2 - 1} - \frac{q^{-2k-2l} - 1}{q^2 - 1} \right). \tag{50} \]

\[ \blacklozenge \quad \text{Along the same lines, one can derive recursion relations for the polynomials } \Delta_{ij,ij'}^{kl} \text{ where } i + j + i' + j' \text{ is odd} – \text{this corresponds to the choices } (ij, i'j') = (00, 01), (00, 10), (01, 00), (10, 00), (11, 00), (11, 01), (10, 11), (11, 11). \text{ One has the two following lemmas:} \]

**Lemma A.2** If \( i + j + i' + j' \) is odd, the polynomials \( \Delta_{ij,ij'}^{kl}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) \) and \( \Delta_{ij,ij'}^{kl}(q^{-\varepsilon_1}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right)), q^{-\varepsilon_2}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right)) \) are identically vanishing.

**Lemma A.3** The derivatives \( \frac{\partial}{\partial d_1} \Delta_{00,01}^{kl}(d_1, d_2), \frac{\partial}{\partial d_2} \Delta_{00,01}^{kl}, \frac{\partial}{\partial d_1} \Delta_{01,00}^{kl}, \frac{\partial}{\partial d_2} \Delta_{01,00}^{kl}, \frac{\partial}{\partial d_1} \Delta_{10,00}^{kl}, \frac{\partial}{\partial d_2} \Delta_{10,00}^{kl} \) taken at \( (a_1, a_2) = (\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) \) are all zero.

Consider for example the quantity \( \Delta_{00,01}^{kl} \) which satisfies the recursion relation

\[ \Delta_{00,01}^{k+1,l}(a_1, a_2) = a_1 a_2 \Delta_{00,01}^{kl}(a_1, a_2) + (a_1^2 - a_2^2) \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \frac{s}{8} \Delta_{10,00}^{kl} + \frac{s}{8} \varepsilon_1 \Delta_{01,00}^{kl} \right) + \frac{s^2}{16} (a_2^2 - a_1^2) \varepsilon_2 \Delta_{10,11}^{kl} + \frac{s^2}{16} (a_2^2 - a_1^2) \varepsilon_1 \varepsilon_2 \Delta_{01,11}^{kl}) \left( M_{\varepsilon_1}(a_1, d_1), M_{\varepsilon_2}(a_2, d_2) \right). \tag{51} \]

obtained from eq. (41). Thus for \( (a_1, a_2) = (\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) \), one has \( \Delta_{00,01}^{k+1,l} = \Delta_{00,01}^{kl} = \Delta_{00,01}^{kl} \), while the recursion relation on \( l \) leads to \( \Delta_{00,01}^{k+1,l} = \Delta_{00,01}^{kl} = \Delta_{00,01}^{kl} \); hence \( \Delta_{00,01}^{kl} = \left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right) = 0. \)

For \( (a_1, a_2) = q^{-\varepsilon_1}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right), q^{-\varepsilon_2}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right)) \), one has \( \Delta_{00,01}^{k+1,l} = q^{-\varepsilon_1 - \varepsilon_2} \Delta_{00,01}^{kl} \) and \( \Delta_{00,01}^{k+1,l} = q^{-\varepsilon_1 - \varepsilon_2} \Delta_{00,01}^{kl} \); hence \( \Delta_{00,01}^{kl} = q^{-\varepsilon_1}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right), q^{-\varepsilon_2}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right)) = 0. \)

The same statement holds for the other cases, which proves Lemma A.2.

Now taking the derivative with respect to \( a_1 \) of eq. (51), one gets

\[ \frac{\partial}{\partial a_1} \Delta_{00,01}^{k+1,l}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) = \Delta_{00,01}^{kl}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) + \frac{\partial}{\partial a_1} \Delta_{00,01}^{kl}(\left(\begin{array}{c} 1 \\ 1 \end{array}\right), \left(\begin{array}{c} 1 \\ 1 \end{array}\right)) \]

\[ + \frac{s}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} (\Delta_{10,00}^{kl} + \varepsilon_1 \Delta_{01,00}^{kl})(q^{-\varepsilon_1}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right), q^{-\varepsilon_2}(\left(\begin{array}{c} 1 \\ -1 \end{array}\right)). \tag{52} \]

18
and analogous relations for the other combinations of the quadruplets \((i,j,i',j')\) with \(i + j + i' + j'\) odd. From Lemma A.2, one has therefore

\[
\frac{\partial}{\partial a_1} \Delta_{00,01}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = \frac{\partial}{\partial a_1} \Delta_{00,01}^{0l} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right). \tag{53}
\]

Repeating the procedure for the recursion relations on \(l\), one finds that the r.h.s. of (53) is zero and one concludes that

\[
\frac{\partial}{\partial a_1} \Delta_{00,01}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = 0. \tag{54}
\]

The same statement holds for all the derivatives of the polynomials \(\Delta_{ij,i'j'}^{kl}\) involved in eqs. (39c) to (39f), which proves Lemma A.3.

It follows then from Lemmas A.2 and A.3 and eqs. (39c) to (39f) that

\[
\langle [A, B], a^k d^l \rangle = \langle [A, C], a^k d^l \rangle = \langle [D, B], a^k d^l \rangle = \langle [D, C], a^k d^l \rangle = 0. \tag{55}
\]

\[
\mathbf{\downarrow} \quad \text{It remains to evaluate } \langle AD - DA, a^k d^l \rangle. \quad \text{One has from eq. (42a)}
\]

\[
\frac{\partial^2}{\partial a_1 \partial d_2} \Delta_{00,00}^{k+1,l} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) &= \frac{\partial^2}{\partial a_1 \partial d_2} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) + \frac{\partial}{\partial d_2} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right)
\]

\[
- \frac{s^2}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \Delta_{10,01}^{kl} + \varepsilon_1 \Delta_{01,01}^{kl} + \varepsilon_2 \Delta_{10,10}^{kl} + \varepsilon_1 \varepsilon_2 \Delta_{01,10}^{kl} \right) \left( q^{-\varepsilon_1} \left( -1 \right), q^{-\varepsilon_2} \left( -1 \right) \right), \tag{56}
\]

\[
\frac{\partial^2}{\partial a_2 \partial d_1} \Delta_{00,00}^{k+1,l} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) &= \frac{\partial^2}{\partial a_2 \partial d_1} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) + \frac{\partial}{\partial d_1} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right)
\]

\[
- \frac{s^2}{4} \sum_{\varepsilon_1, \varepsilon_2 = \pm 1} \left( \Delta_{10,01}^{kl} + \varepsilon_1 \Delta_{01,01}^{kl} + \varepsilon_2 \Delta_{10,10}^{kl} + \varepsilon_1 \varepsilon_2 \Delta_{01,10}^{kl} \right) \left( q^{-\varepsilon_1} \left( -1 \right), q^{-\varepsilon_2} \left( -1 \right) \right). \tag{57}
\]

Therefore

\[
\left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{k+1,l} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right)
\]

\[
+ \left( \frac{\partial}{\partial d_2} - \frac{\partial}{\partial d_1} \right) \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right). \tag{58}
\]

Then we use the following lemma:

**Lemma A.4** One has

\[
\frac{\partial}{\partial a_1} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = \frac{\partial}{\partial d_2} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = k,
\]

\[
\frac{\partial}{\partial d_1} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = \frac{\partial}{\partial d_2} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = l.
\]

From equation (42a), one has

\[
\frac{\partial}{\partial d_1} \Delta_{00,00}^{k+1,l} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) = \frac{\partial}{\partial d_1} \Delta_{00,00}^{kl} \left( \left( \frac{1}{1} \right), \left( \frac{1}{1} \right) \right) \tag{59}
\]
and similarly
\[
\frac{\partial}{\partial d_i} \Delta_{00,00}^{0_{l+1}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta_{00,00}^{0_{l}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) + \frac{\partial}{\partial d_i} \Delta_{00,00}^{0_{l}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) .
\]  
(60)

Since \( \Delta_{00,00}^{0_{l+1}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \Delta_{00,00}^{0_{l}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) \) and \( \Delta_{00,00}^{0_{0}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = 1 \), one obtains the last line of Lemma A.4. One gets the first line by exchanging the roles of \( k \) and \( l \).

Then Lemma A.4 implies
\[
\left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{0_{l+1}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{0_{l}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) .
\]  
(61)

Similarly, one gets
\[
\left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{0_{l+1}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{0_{l}} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) .
\]  
(62)

Hence
\[
\left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{kl} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \Delta_{00,00}^{00} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = 0 .
\]  
(63)

Therefore, from eq. (39g), one obtains
\[
\langle [A, D], a^k d^l \rangle = 0 .
\]  
(64)

Now we have to compute the evaluation of the (anti)commutators between \( A, B, C, D \) on the generic elements \( a^k d^l b \) and \( a^k d^l c \) of the Poincaré–Birkhoff–Witt basis of \( A \). Let us define
\[
\Delta(a^k d^l b) = \Delta(a^k d^l) (a \otimes b + b \otimes d) = \sum_{i,j,i',j' \in \{0,1\}} \beta_{ij,i'j'}^{kl} \left( \left( \frac{a_1}{d_1}, \frac{a_2}{d_2} \right) \right) b^i c^j \otimes b'^i c'^j .
\]  
(65)

It is not difficult to obtain the expressions of the polynomials \( \beta_{ij,i'j'}^{kl} \) in terms of the \( \Delta_{ij,i'j'}^{kl} \)'s from the multiplication law (27). One obtains (the other possibilities are of no interest for our goal):

\[
\begin{align*}
\beta_{00,00}^{kl} &= \frac{1}{2} sa_1(a_2^2 - d_2^2) \Delta_{00,10}^{kl} + \frac{1}{2} sd_2(a_1^2 - d_1^2) \Delta_{00,10}^{kl} , \\
\beta_{10,00}^{kl} &= d_2 \Delta_{a_1}^{kl} + \frac{1}{2} sr_1(a_2^2 - d_2^2) \Delta_{01,10}^{kl} - \frac{1}{2} s^2 d_1(a_1^2 - d_1^2) \Delta_{01,10}^{kl} , \\
\beta_{01,00}^{kl} &= \frac{1}{2} rs_1(a_2^2 - d_2^2) \Delta_{01,10}^{kl} - \frac{1}{2} s^2 d_1(a_1^2 - d_1^2) \Delta_{10,10}^{kl} + d_2(a_1^2 - d_1^2) \Delta_{10,10}^{kl} , \\
\beta_{00,00}^{kl} &= a_1 \Delta_{00,00}^{kl} + \frac{1}{2} s^2 d_1(a_2^2 - d_2^2) \Delta_{00,10}^{kl} - \frac{1}{2} r s d_2(a_1^2 - d_1^2) \Delta_{00,10}^{kl} , \\
\beta_{00,01}^{kl} &= \frac{1}{2} sa_1(a_2^2 - d_2^2) \Delta_{00,10}^{kl} + \frac{1}{2} s^2 d_1(a_1^2 - d_1^2) \Delta_{00,10}^{kl} - \frac{1}{2} r s d_2(a_1^2 - d_1^2) \Delta_{00,10}^{kl} , \\
\beta_{10,10}^{kl} &= ra_1 \Delta_{10,10}^{kl} - sd_1 \Delta_{00,10}^{kl} + sa_2 \Delta_{00,10}^{kl} - r d_2 \Delta_{00,10}^{kl} , \\
\beta_{00,01}^{kl} &= \frac{1}{2} rs_1(a_2^2 - d_2^2) \Delta_{00,10}^{kl} - \frac{1}{2} s^2 d_1(a_1^2 - d_1^2) \Delta_{00,10}^{kl} + \frac{1}{2} s^2 d_1(a_2^2 - d_2^2) \Delta_{10,10}^{kl} - \frac{1}{2} r s d_2(a_1^2 - d_1^2) \Delta_{10,10}^{kl} , \\
\beta_{01,01}^{kl} &= sa_2 \Delta_{00,10}^{kl} - r d_2 \Delta_{00,10}^{kl} + \frac{1}{2} rs_1(a_2^2 - d_2^2) \Delta_{10,10}^{kl} - \frac{1}{2} s^2 d_1(a_1^2 - d_1^2) \Delta_{10,10}^{kl} , \\
\beta_{10,10}^{kl} &= ra_1 \Delta_{10,10}^{kl} - sd_1 \Delta_{10,10}^{kl} + \frac{1}{2} s^2 d_1(a_2^2 - d_2^2) \Delta_{10,10}^{kl} - \frac{1}{2} r s d_2(a_1^2 - d_1^2) \Delta_{10,10}^{kl} .
\end{align*}
\]  
(66)

The evaluations of the (anti)commutators are given by
\[
\langle [B + CB, a^k d^l b] \rangle = \beta_{10,01}^{kl} + \beta_{01,10}^{kl} ,
\]  
(67a)
\[\langle B^2, a^k d^b c \rangle = \beta_{10,10}^{kl}, \quad \langle C^2, a^k d^b c \rangle = \beta_{01,01}^{kl}, \quad (67b)\]

\[\langle AB - BA, a^k d^b c \rangle = \frac{\partial}{\partial a_1} \beta_{00,10}^{kl} - \frac{\partial}{\partial a_2} \beta_{10,00}^{kl} = s^2(\Delta_{10,01}^{kl} + \Delta_{01,10}^{kl}) - 2rs\Delta_{10,10}^{kl} + (1 + \frac{\partial}{\partial a_1} - \frac{\partial}{\partial a_2})\Delta_{00,00}^{kl}, \quad (67c)\]

\[\langle AC - CA, a^k d^b c \rangle = \frac{\partial}{\partial a_1} \beta_{00,10}^{kl} - \frac{\partial}{\partial a_2} \beta_{10,00}^{kl} = 2s^2\Delta_{10,10}^{kl} - rs(\Delta_{10,01}^{kl} + \Delta_{01,10}^{kl}), \quad (67d)\]

\[\langle DB - BD, a^k d^b c \rangle = \frac{\partial}{\partial d_1} \beta_{00,10}^{kl} - \frac{\partial}{\partial d_2} \beta_{10,00}^{kl} = 2rs\Delta_{10,10}^{kl} - s^2(\Delta_{10,01}^{kl} + \Delta_{01,10}^{kl}) + (1 + \frac{\partial}{\partial d_1} - \frac{\partial}{\partial d_2})\Delta_{00,00}^{kl}, \quad (67e)\]

\[\langle DC - CD, a^k d^b c \rangle = \frac{\partial}{\partial d_1} \beta_{00,10}^{kl} - \frac{\partial}{\partial d_2} \beta_{10,00}^{kl} = rs(\Delta_{10,01}^{kl} + \Delta_{01,10}^{kl}) - 2s^2\Delta_{10,10}^{kl}, \quad (67f)\]

\[\langle AD - DA, a^k d^b c \rangle = \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \beta_{00,00}^{kl} = s(\Delta_{10,00}^{kl} - \Delta_{00,10}^{kl}) - (\frac{\partial}{\partial a_1} + \frac{\partial}{\partial d_1})\Delta_{10,00}^{kl} + (\frac{\partial}{\partial a_2} + \frac{\partial}{\partial d_2})\Delta_{00,10}^{kl} \right), \quad (67g)\]

where all polynomials \(\beta_{ij,j'}^{kl}, \Delta_{ij,j'}^{kl}\) and their derivatives in (67) are taken at \(\left(\frac{a_1}{d_1}, \frac{a_2}{d_2}\right) = \left(\frac{1}{1}, \frac{1}{1}\right)\).

Similarly, defining

\[\Delta(a^k d^b c) = \Delta(a^k d^b)(c \otimes a + d \otimes c) = \sum_{i,j,j' \in \{0, 1\}} \gamma_{ij,j'}^{kl} \left( \left( \frac{a_1}{d_1} \right), \left( \frac{a_2}{d_2} \right) \right) b^i c^j \otimes b^{i'} c^{j'}, \quad (68)\]

one gets

\[
\begin{align*}
\gamma_{00,00}^{kl} &= \frac{1}{2} sa_2(a_2^2 - d_2^2)\Delta_{01,00}^{kl} + \frac{1}{2} sd_1(a_2^2 - d_2^2)\Delta_{00,10}^{kl} , \\
\gamma_{10,00}^{kl} &= \frac{1}{2} s^2 a_1(a_2^2 - d_2^2)\Delta_{01,00}^{kl} - \frac{1}{2} rsd_1(a_2^2 - d_2^2)\Delta_{01,10}^{kl} + \frac{1}{2} s^2 a_2(a_2^2 - d_2^2)\Delta_{10,00}^{kl} , \\
\gamma_{01,00}^{kl} &= a_2\Delta_{00,00}^{kl} + \frac{1}{2} s^2 a_1(a_2^2 - d_2^2)\Delta_{01,01}^{kl} - \frac{1}{2} rsd_1(a_2^2 - d_2^2)\Delta_{01,01}^{kl} , \\
\gamma_{00,10}^{kl} &= \frac{1}{2} s^2 d_1(a_2^2 - d_2^2)\Delta_{00,11}^{kl} + \frac{1}{2} rsa_2(a_2^2 - d_2^2)\Delta_{00,11}^{kl} - \frac{1}{2} s^2 d_2(a_2^2 - d_2^2)\Delta_{00,11}^{kl} , \\
\gamma_{01,10}^{kl} &= \frac{1}{2} s^2 a_1(a_2^2 - d_2^2)\Delta_{01,11}^{kl} - \frac{1}{2} rsd_1(a_2^2 - d_2^2)\Delta_{01,11}^{kl} + \frac{1}{2} rs a_2(a_2^2 - d_2^2)\Delta_{01,11}^{kl} - \frac{1}{2} s^2 d_2(a_2^2 - d_2^2)\Delta_{01,11}^{kl} , \\
\gamma_{10,10}^{kl} &= a_1\Delta_{10,00}^{kl} - rd_1\Delta_{10,00}^{kl} + ra_2\Delta_{00,01}^{kl} - sd_2\Delta_{00,10}^{kl} , \\
\gamma_{00,01}^{kl} &= \frac{1}{2} s^2 a_2\Delta_{00,10}^{kl} - \frac{1}{2} s^2 d_1\Delta_{00,10}^{kl} + \frac{1}{2} rs a_2(a_2^2 - d_2^2)\Delta_{01,10}^{kl} - \frac{1}{2} s^2 d_2(a_2^2 - d_2^2)\Delta_{01,10}^{kl} , \\
\gamma_{01,01}^{kl} &= \frac{1}{2} rs a_2\Delta_{00,00}^{kl} + \frac{1}{2} s^2 d_2\Delta_{00,10}^{kl} + \frac{1}{2} s^2 a_2(a_2^2 - d_2^2)\Delta_{01,10}^{kl} - \frac{1}{2} rs d_1(a_2^2 - d_2^2)\Delta_{01,11}^{kl} , \\
\gamma_{01,10}^{kl} &= \frac{1}{2} r s a_2\Delta_{00,00}^{kl} - \frac{1}{2} s^2 a_2\Delta_{00,11}^{kl} + \frac{1}{2} rs a_2(a_2^2 - d_2^2)\Delta_{01,11}^{kl} - \frac{1}{2} rs d_1(a_2^2 - d_2^2)\Delta_{01,11}^{kl} .
\end{align*}
\]

Again, the evaluations of the (anti)commutators are given by

\[\langle BC + CB, a^k d^b c \rangle = \gamma_{10,01}^{kl} + \gamma_{01,10}^{kl}, \quad (70a)\]

\[\langle B^2, a^k d^b c \rangle = \gamma_{10,10}^{kl}, \quad \langle C^2, a^k d^b c \rangle = \gamma_{01,01}^{kl}, \quad (70b)\]

\[\langle AB - BA, a^k d^b c \rangle = \frac{\partial}{\partial a_1} \gamma_{00,10}^{kl} - \frac{\partial}{\partial a_2} \gamma_{10,00}^{kl} = rs(\Delta_{10,01}^{kl} + \Delta_{01,10}^{kl}) - 2s^2\Delta_{01,01}^{kl}, \quad (70c)\]

\[\langle AC - CA, a^k d^b c \rangle = \frac{\partial}{\partial a_1} \gamma_{00,01}^{kl} - \frac{\partial}{\partial a_2} \gamma_{10,00}^{kl} \]
Finally, one defines

\[
\mu_{\ell 0,00} = \left(\frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1}\right) \gamma^{kl}_{00,00},
\]

\[
\mu^{kl}_{00,10} = \frac{1}{2} s \gamma_{kl}(a_1^2 - d_1^2) \Delta_{01,10}^{kl} - \frac{1}{2} s r s \gamma_{kl}(a_1^2 - d_1^2) \Delta_{10,10}^{kl} + \frac{1}{4} s^2 a_2 d_1(a_1^2 - d_1^2) \Delta_{10,10}^{kl} + \frac{1}{4} s^2 a_1 d_2(a_1^2 - d_1^2) \Delta_{11,00}^{kl},
\]

\[
\mu^{kl}_{01,00} = \frac{1}{2} s r s d_1 a_2(a_1^2 - d_1^2) \Delta_{01,00}^{kl} - \frac{1}{2} s r s a_1 d_2(a_1^2 - d_1^2) \Delta_{01,10}^{kl} + \frac{1}{4} s^2 r^2 a_1 d_2(a_1^2 - d_1^2) \Delta_{01,11}^{kl} + \frac{1}{4} s^2 r^2 a_2 d_1(a_1^2 - d_1^2) \Delta_{01,11}^{kl}.
\]

\[
\mu^{kl}_{01,01} = \frac{1}{2} s r s d_1 a_2(a_1^2 - d_1^2) \Delta_{01,10}^{kl} - \frac{1}{2} s r s a_1 d_2(a_1^2 - d_1^2) \Delta_{01,10}^{kl} + \frac{1}{4} s^2 r^2 a_1 d_2(a_1^2 - d_1^2) \Delta_{01,11}^{kl} + \frac{1}{4} s^2 r^2 a_2 d_1(a_1^2 - d_1^2) \Delta_{01,11}^{kl}.
\]

\[
\mu^{kl}_{01,10} = \frac{1}{2} s r s d_1 a_2(a_1^2 - d_1^2) \Delta_{01,00}^{kl} - \frac{1}{2} s r s a_1 d_2(a_1^2 - d_1^2) \Delta_{01,00}^{kl} + \frac{1}{4} s^2 r^2 a_1 d_2(a_1^2 - d_1^2) \Delta_{01,01}^{kl} + \frac{1}{4} s^2 r^2 a_2 d_1(a_1^2 - d_1^2) \Delta_{01,01}^{kl}.
\]

One gets

\[
\Delta(a^k d^l b c) = \Delta(a^k d^l)(\Delta(b) c) = \Delta(a^k d^l)(a d \otimes b c + b c \otimes a d + r a c \otimes a b - r d b \otimes d c)
\]

\[
= \sum_{i,j,i',j' \in \{0,1\}} \mu^{kl}_{ij,i'j'}(a_1^{d_1}, a_2^{d_2}) b^{i} c^{j} \otimes b^{i'} c^{j'}.
\]

Finally, one defines

\[
\Delta(a^k d^l b c) = \Delta(a^k d^l)(\Delta(b) c) = \Delta(a^k d^l)(a d \otimes b c + b c \otimes a d + r a c \otimes a b - r d b \otimes d c)
\]

\[
= \sum_{i,j,i',j' \in \{0,1\}} \mu^{kl}_{ij,i'j'}(a_1^{d_1}, a_2^{d_2}) b^{i} c^{j} \otimes b^{i'} c^{j'}.
\]
\begin{align}
\mu_{00,01}^{k l} &= -\frac{1}{4} rs^3 a_1 d_2 (a_1^2 - d_1^2) (a_2^2 - d_2^2) \Delta_{11,11}^{kl} + \frac{1}{4} r^2 s^2 d_1 d_2 (a_1^2 - d_1^2) (a_2^2 - d_2^2) \Delta_{10,11}^{kl}, \\
\mu_{10,10}^{k l} &= -\frac{1}{2} s^2 (r^2 + s^2) a_2 d_2 (a_1^2 - d_1^2)^2 \Delta_{11,10}^{kl} + \frac{1}{4} r^2 s^3 (a_2^2 - d_2^2)^2 (a_2^2 + d_2^2) \Delta_{11,11}^{kl}, \\
\mu_{01,01}^{k l} &= \frac{1}{2} r^2 s a_1 a_2 (a_1^2 - d_1^2) \Delta_{00,01}^{kl} - \frac{1}{2} r^2 s d_1 d_2 (a_1^2 - d_1^2)^2 \Delta_{01,11}^{kl} + \frac{1}{4} r^2 s^3 d_1 a_2 (a_1^2 - d_1^2) (a_2^2 - d_2^2) \Delta_{01,10}^{kl}, \\
\mu_{10,01}^{k l} &= -\frac{1}{2} s r^2 a_1 a_2 (a_1^2 - d_1^2)^2 \Delta_{11,00}^{kl} - \frac{1}{2} s r^2 s a_1 d_1 (a_2^2 - d_2^2) \Delta_{01,10}^{kl} - \frac{1}{4} s^2 (r^2 + s^2) a_2 d_2 (a_1^2 - d_1^2) \Delta_{01,11}^{kl}, \\
\mu_{10,10}^{k l} &= -\frac{1}{2} s (r^2 + s^2) a_1 a_2 d_1 (a_1^2 - d_1^2)^2 \Delta_{10,11}^{kl} - \frac{1}{2} s (r^2 + s^2) a_2 d_2 (a_1^2 - d_1^2) \Delta_{10,10}^{kl},
\end{align}

Once again, the evaluations of the (anti)commutators are given by

\begin{align}
\langle BC + CB, a^k d^l b c \rangle &= \mu_{01,01}^{k l} + \mu_{01,10}^{k l}, \\
\langle B^2, a^k d^l b c \rangle &= \mu_{10,10}^{k l}, \\
\langle AB - BA, a^k d^l b c \rangle &= \frac{\partial}{\partial a_1} \mu_{00,00}^{k l} - \frac{\partial}{\partial a_2} \mu_{10,00}^{k l} \\
&= -rs^2 \Delta_{10,00}^{kl} + sr^2 \Delta_{01,00}^{kl} - rs^2 \Delta_{00,10}^{kl} + sr^2 \Delta_{00,01}^{kl}, \\
\langle AC - CA, a^k d^l b c \rangle &= \frac{\partial}{\partial a_1} \mu_{00,01}^{k l} - \frac{\partial}{\partial a_2} \mu_{01,00}^{k l} \\
&= rs^2 \Delta_{10,01}^{kl} - rs^2 \Delta_{01,01}^{kl} + sr^2 \Delta_{00,11}^{kl} - rs^2 \Delta_{00,01}^{kl}, \\
\langle DB - BD, a^k d^l c \rangle &= \frac{\partial}{\partial d_1} \mu_{00,00}^{k l} - \frac{\partial}{\partial d_2} \mu_{10,00}^{k l} \\
&= rs^2 \Delta_{10,00}^{kl} - rs^2 \Delta_{01,00}^{kl} + rs^2 \Delta_{00,10}^{kl} - rs^2 \Delta_{00,01}^{kl}, \\
\langle DC - CD, a^k d^l b c \rangle &= \frac{\partial}{\partial d_1} \mu_{00,01}^{k l} - \frac{\partial}{\partial d_2} \mu_{01,00}^{k l} \\
&= -sr^2 \Delta_{10,10}^{kl} + rs^2 \Delta_{01,10}^{kl} - sr^2 \Delta_{00,11}^{kl} + rs^2 \Delta_{00,01}^{kl}, \\
\langle AD - DA, a^k d^l b c \rangle &= \left( \frac{\partial^2}{\partial a_1 \partial d_2} - \frac{\partial^2}{\partial a_2 \partial d_1} \right) \mu_{00,00}^{k l}.
\end{align}

The (polynomials) \( \mu_{ij,ij'}^{k l}, \Delta_{ij,ij'}^{k l} \) and their derivatives in (74) are taken at \( \left( \frac{a_1}{d_1}, \frac{a_2}{d_2} \right) = \left( \frac{1}{1}, \frac{1}{1} \right) \). Expressions (74a) and (74b) are obviously vanishing while expressions (74c) to (74f) are zero thanks to Lemma A.2. Finally, \( \frac{\partial^2}{\partial a_1 \partial d_2} \mu_{00,00}^{k l} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = \frac{\partial^2}{\partial a_2 \partial d_1} \mu_{00,00}^{k l} \left( \left( \frac{1}{1}, \frac{1}{1} \right) \right) = 4r (\Delta_{01,11}^{kl} - \Delta_{10,11}^{kl}) \), so that expression (74g) is also vanishing. Therefore one has

\begin{align}
\langle [A, B], a^k d^l b c \rangle &= \langle [A, C], a^k d^l b c \rangle = \langle [D, B], a^k d^l b c \rangle = \langle [D, C], a^k d^l b c \rangle = 0, \\
\langle [A, D], a^k d^l b c \rangle &= \langle \{ B, C \}, a^k d^l b c \rangle = \langle B^2, a^k d^l b c \rangle = \langle C^2, a^k d^l b c \rangle = 0.
\end{align}
elements of the Poincaré–Birkhoff–Witt basis of $\mathcal{A}$, as abstract formulae defining the algebra given in Theorem 3. One has

$$\langle (A + D)^n, a^k d^l \rangle = \langle \otimes_n (A + D), \Delta^{(n)}(a^k d^l) \rangle.$$  

(76)

The generalization of the formula (37) for the $n$-fold coproduct reads as

$$\Delta^{(n)}(a^k d^l) = \sum_{i_1, i_2, \ldots, i_n, j_n \in \{0,1\}} \Delta^{(n)k_l}_{i_1j_1, \ldots, i_nj_n} \left(\begin{array}{c} a_1 \\ d_1 \\ \vdots \\ a_n \\ d_n \end{array}\right) b_i^1 c_j^1 \otimes \cdots \otimes b_i^n c_j^n,$$

(77)

where $a_i = 1 \otimes \ldots \otimes 1 \otimes a \otimes 1 \ldots \otimes 1$ and $a$ stands at the place $i$ of the tensor product, with a similar definition for $d_i$. Thus one has

$$\langle \otimes_n (A + D), \Delta^{(n)}(a^k d^l) \rangle = \left(\otimes_n (A + D), \Delta^{(n)k_l}_{00, \ldots, 00} \left(\begin{array}{c} a_1 \\ d_1 \\ \vdots \\ a_n \\ d_n \end{array}\right) \right).$$

(78)

Now the main observation is that the terms in (77) coming from $b^2$ or $c^2$ cancel when evaluated on $A + D$ since $\langle A + D, a^k d^l b^2 \rangle = \langle A + D, a^k d^l c^2 \rangle = \langle A + D, \frac{1}{2} s a^k d^l (a^2 - d^2) \rangle = 0$. It follows that the only relevant term of $\Delta^{(n)k_l}_{00, \ldots, 00} \left(\begin{array}{c} a_1 \\ d_1 \\ \vdots \\ a_n \\ d_n \end{array}\right)$ is $a_1^k d_1^l \ldots a_n^k d_n^l = a^k d^l \otimes \cdots \otimes a^k d^l$. Therefore

$$\langle (A + D)^n, a^k d^l \rangle = (k + l)^n,$$

(79)

from which we easily deduce

$$\langle q^{A+D}, a^k d^l \rangle = \langle K, a^k d^l \rangle = q^{k+l}.$$  

(80)

Moreover one has form eqs. (65), (66), (68), (69) and the previous results (note the shift in the exponential !):

$$\langle q^{A+D-1} B, a^k d^l b \rangle = \langle q^{A+D-1} C, a^k d^l c \rangle = q^{k+l}.$$  

(81)

Then comparing eqs. (49), (50), (55), (64), (71), (75) with the formulae (80) and (81), Theorem 3 immediately follows.
