### **Abstract**

Tau functions expressed as fermionic expectation values are shown to provide a natural description of a number of random exclusion processes and statistical models involving configurations of identical fermi particles on the integer lattice. These include a discrete version of simple exclusion processes (ASEP), nonintersecting random walkers, lattice Coulomb gas models and others. This also provides a powerful tool for combinatorial calculations involving paths between pairs of partitions.

**Based on joint work with Alexander Yu. Orlov.**
